DATA WAREHOUSING TASK

Name companies which egt benefits from using data warehousing along with their problem question and their benefits with facts and figures?

1. Walmart — Retail

Problem:
Walmart receives enormous amounts of data from stores, online sales, inventory, suppliers, customers, and other sources. The challenge was to combine this data and analyze it quickly instead of making decisions from separate systems. Walmart's finance organization specifically describes bringing together disparate sources and preparing/cleansing data in a **data warehousing solution** before analysis.

Facts & figures:

- Walmart supports approximately **10,500 stores and clubs**.
- It has around **2.3 million associates worldwide**.
- Its systems deal with **trillions of transactions**.
- Walmart has reported that its analytics environment brought together **200+ internal and external data streams**.
- One reported example says complex business questions that previously took **weeks** could be answered in **minutes** using its analytics infrastructure.

Benefits of Data Warehousing:

- Centralizes sales, inventory, customer, and financial data.
- Makes historical data available for analysis.
- Helps management make faster decisions.
- Supports demand forecasting and inventory management.
- Provides a consistent source of data for BI dashboards.

---

2. Netflix — Entertainment/Streaming

Problem:
Netflix generates huge amounts of data from viewing activity, applications, campaigns, and its various services. It needed a scalable system to store and analyze this data and provide the same governed data to many teams.

Netflix uses a **data lake/data warehouse strategy**, with data flowing into systems such as Amazon S3 and Amazon Redshift and then being analyzed through Tableau.

Facts & figures:

- A Netflix analytics case study reported **86 million members** at the time.
- Netflix was handling **more than 700 billion events per day** in the cited Tableau case study.
- Netflix's data platform has grown to **millions of tables** and **tens of thousands of scheduled workloads**.

Benefits of Data Warehousing:

- Stores huge volumes of historical data.
- Allows analysis of viewing patterns.
- Helps country managers understand what audiences watch.
- Provides a **single governed data source** for multiple users.
- Supports business intelligence and data-driven content decisions.

---

3. UPS — Logistics

Problem:
UPS historically had data distributed across different systems and data warehouses. According to a UPS case study, answering a business question could previously take **about a month** because teams had to locate the data, make it accessible, and then analyze it.

Facts & figures:

- UPS operates in **200+ countries and territories**.
- UPS had approximately **460,000 employees** in 2025.
- UPS reported **$88.7 billion revenue in 2025**.
- Its analytics tools provide historical, current, and predictive insights and can analyze **two years of detailed shipment data**.

Benefits of Data Warehousing/Analytics:

- Combines logistics and shipment information.
- Faster access to business data.
- Helps identify shipment trends and patterns.
- Supports supply-chain optimization.
- Enables customizable reports and drill-down analysis.
- Helps management monitor transportation performance.
